

Present anode technology limits the use of Silicon Metal (Si) powders to a blended form with graphite, [resulting in less than 10 wt% Si](#) in Li-ion batteries. This explains the limited performance improvement achieved to date.

A [recent report](#) by Wood Mackenzie Power projects that energy storage deployments are estimated to grow 1,300% from a 12 Gigawatt-hour market in 2018 to a 158 Gigawatt-hour market in 2024. This is why, even at these low content levels, demand for Silicon Metal powders is estimated to represent an addressable market of US \$ 1B by 2022² expanding at a [CAGR of 38.9% between 2019 – 2024](#).

HPQ AND PYROGENESIS WELL POSITIONED TO ASSUME FIRST MOVER ADVANTAGE IN THE MARKET

Building upon the success of the modified GEN2 *PUREVAP™* proof of concept test, PyroGenesis is designing additional process improvements to the modified GEN2 *PUREVAP™* Reactor in order to demonstrate the commercial potential of the high yield, low cost process we are developing to produce Spherical Silicon Metal (Si) nano-powders for the Li-ion batteries markets.

This represents a unique multibillion-dollar business opportunity that could subsequently lead to the wide scale adoption of our Material in the battery market. If this occurs, HPQ and PyroGenesis would then be well positioned to assume a dominant market position. In Q1 2020, the plan is to have the fully modified Gen2 *PUREVAP™* reactor operational to validate that our approach both works and is scalable while also producing samples for industry participants and research institutions.

*“PyroGenesis has a long the track record of taking high-technology projects from proof of concept to global commercial scalability, so if anybody has the knowhow to use the silicon metal produced by HPQ *PUREVAP™*QRR and make spherical Silicon Metal (Si) nano-powders for use as high-capacity anode materials in the next generations Li-ion batteries, it is them,”* said Bernard Tourillon, President and CEO HPQ Silicon. *“Silicon Metal’s potential to meet energy storage demand is undeniable and generating [massive investments](#), as well as, serious industry interest, so our timing could not be better.”*

*“We are delighted by the *PUREVAP™* Gen 2’s recent test results from which it has established a very important proof of concept for the production of spherical nano powders for the Lithium-ion batteries market,”* said M. P Peter Pascali, President and CEO of PyroGenesis Canada Inc. *“The success of this testing paves the way for an interesting business opportunity for both PyroGenesis and HPQ. The goal is to significantly increase the performance of Li-ion batteries, currently in demand, using silicon metal (Si) anodes, at a competitive cost. The potential from the battery and energy storage markets alone is estimated, on first review, to be quite significant.”*

About Silicon Metal

Silicon Metal (Si) is one of today’s strategic materials needed to fulfil the renewable energy revolution presently under way. Silicon does not exist in its pure state; it must be extracted from quartz, one of the most abundant minerals of the earth’s crust and other expensive raw materials in a carbothermic process.

About HPQ Silicon

[HPQ Silicon Resources Inc. \(TSX-V: HPQ\)](#) is developing, with [PyroGenesis Canada Inc. \(TSX-V: PYR\)](#), a high-tech company that designs, develops, manufactures and commercializes plasma base processes, the innovative *PUREVAP™* “Quartz Reduction Reactors” (QRR), a truly 2.0 Carbothermic process (patent pending), which will permit the One Step transformation of Quartz (SiO₂) into High Purity Silicon (Si) at prices that will propagate its considerable renewable energy potential. The Gen3 *PUREVAP™* QRR pilot plant that will validate the commercial potential of the process is scheduled to start during Q1 2020.

HPQ, working with PyroGenesis, is also developing a process that can take the High Purity Silicon (Si) made by the PUREVAP™ and manufacture Spherical Silicon Metal nano-powders for Next Gen Li-ion batteries. During Q1 2020, the plan is to validate our game changing manufacturing approach using a modified Gen2 PUREVAP™ reactor to produce spherical Silicon Metal (Si) nano-powders samples for industry participants and research institutions’.

Concurrently, HPQ is also working with industry leader [Apollon Solar](#) to develop a manufacturing capability that uses the High Purity Silicon (Si) made with the PUREVAP™ to make Porous silicon wafers needed for solid-state Li-ion batteries. The first Silicon wafer should be ready to be ship for testing to a battery manufacture (under NDA) during Q1 2020.

Finally, with Apollon Solar, we are also looking into developing a metallurgical pathway of producing Solar Grade Silicon Metal (SoG Si) that will take full advantage of the PUREVAP™ QRR one-step production of Silicon (Si) material of 4N+ purity with low boron count (< 1 ppm).

All in all, HPQ focus is becoming the lowest cost producer of Silicon Metal (Si), High Purity Silicon Metal (Si), Spherical Si nano-powders for Next Gen Li-ion batteries, Porous Silicon Wafers for Solid states Li-ion batteries, Porous Silicon Powders for Li-ion batteries and Solar Grade Silicon Metal (SoG-Si).
